SECTION 1.0 VALUE AND SAVINGS OF COPPER IONIZATION PROGRAM

Welcome--

You have purchased a chemical free water treatment system that eliminates the need for chlorine, a system that is state of the art. We are committed to make servicing your pool and swimming more pleasurable, less time consuming, and more economical to maintain. As a bonus, you'll find a chlorine-free pool healthier for you, your family and friends.

Before installing the Ionizer, read these instructions from cover to cover. Write down any questions you have. If, after reading the entire booklet, you still have questions; PLEASE CALL US – TOLL FREE. You will be glad you did.

A. Benefits of Adding Copper to Your Lifestyle

The following lists the health benefits mentioned in the article in the February 1989 issue of *Better Nutrition Magazine* written by contributing Editor Frank Murry.

1. Nerves will fray without copper.
2. Copper strengthens blood vessel walls.
3. Copper is important to energy metabolism.
4. Copper shares anti-inflammatory powers with zinc, which is important in healing.
5. Taste perception may be influenced by copper.
6. Copper helps prevent anemia, bone and skeletal defects, a degeneration of the nervous system, defects in the color and structure of hair, reproductive problems and abnormal cardiovascular problems.
7. Copper is the key mineral of collagen and elastin which are essential for tendons and blood vessels. A diet totally devoid of copper would cause hemorrhaging severe enough to end life.
8. Women who are deficient in copper and iron are more likely to have problems with sleeping.
9. Copper is a potent antiulcer agent.
10. Without copper, skin becomes fragile, will break easily, and heal slowly.
11. Without copper, bones can fracture
12. Without copper, blood vessels can leak or burst.
13. Copper deficiency can elevate blood pressure.
14. Copper is important to the functionality of the immune system
15. Copper is necessary to convert beta carotene to vitamin A.

16. A copper-deficient diet may cause defective transport of vitamin A from liver to blood.
 17. Copper also may play an important role in cancer prevention.
 18. Copper is one of the more important antioxidants in the blood stream.
 19. Copper in the form of ceruloplasmin keeps iron from rusting within the blood.
-
- B. Copper Ionization is the only way to have *healthy water* in your pool.
 - C. You will save 80-85% on your water care expenditures and 80-85% on your water care time. No more chlorine, shock, algaecides, or stabilizer!
 - D. Pool liners, paint, vinyl, and plaster last three to five times longer, saving *thousands* of dollars.
 - E. Copper ions are non-irritating to skin and will not burn your eyes.
 - F. Copper ions are many times more effective, faster acting, and longer lasting than chlorine in killing algae and bacteria.

SECTION 2.0 ELECTRONIC SYSTEMS AND INSTALLATION

The copper electrode is the only part of the system that has to be installed. It is installed after the pool filter and before the pool heater (if you have a heater).

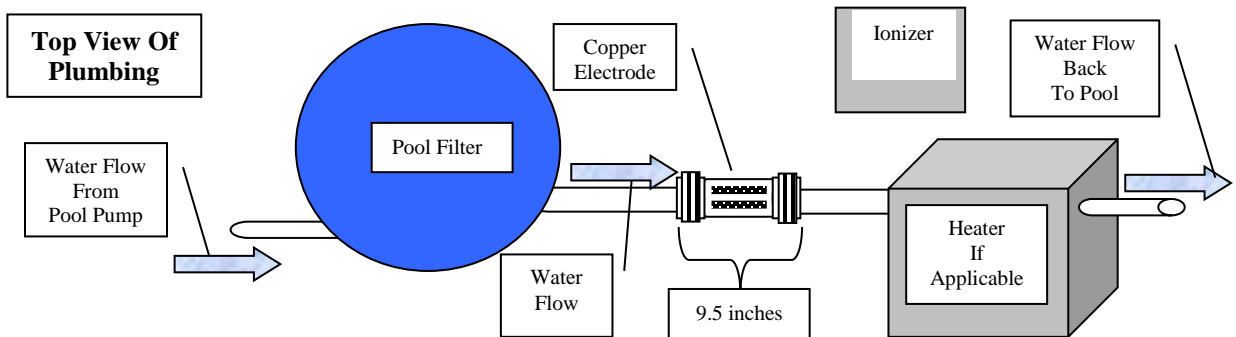

Figure 1

Below is a picture of the electrode:

Figure 2

2.1 Installation of the Electrode

2.1.1 1.5" Plumbing

You will need to use a 2" to 1.5" reducer bushing (not provided). Take a hacksaw and cut approximately 10 inches out of the pipe after the filter. The electrode can be installed horizontally or vertically. Take the male half of each male union, clean them and then cement them on the bushing/reducer provided (Figure 3). Then, clean and cement the above assembly component onto to the remaining pipe ends after your pool filter (Figure 4). Slide in the electrode and hand tighten the female union to the male union.

Figure 3

Figure 4

2.1.2 2" Plumbing

Take a hacksaw and cut approximately 9.5 inches out of the pipe after the filter (11.5 inches for the commercial double electrode). The electrode can be installed horizontally or vertically. Take the male half of each union and clean and cement them on the remaining pipe ends. Slide in the electrode and hand tighten the female union to the male union.

2.2 Connecting the Electronics Unit to the Electrode

Locate the male spades found at each side of the electrode (Page 8; Figure 3). Connect the female plug located at the end of the wire from the electronics unit and it to the male spade located on the electrode (Figure 4). Attach the unconnected wire for the electronics unit to the other side of the electrode (Figure 5). ***It does not matter which wire plugs into which side of the electrode.*** The polarity will alternate the current between the two copper bars on the electrode. Figure 6 illustrates the proper connection for the electronics unit to the electrode.

Figure 3

Figure 4

Figure 5

Figure 6

Question: How does copper get into my pool/spa?

Answer: Your Intec Ionizer will apply a current to the copper electrode and ionize the water. The electrode will slowly release these copper ions into the water stream. The ions are extremely small and can not be seen even with a powerful microscope. The ions are so small that they can easily pass through the cell membrane of algae or bacteria and disrupt their enzyme structure and kill them.

2.3 Electronic System Overview and Specifications

Your new pool ionization system has gone through two separate inspections: (a) by manufacturing, and then, (b) by the shipping department. If you notice any defects on your system, please contact our Quality Assurance Department immediately.

Your unit is powered by 110-220 volts (50-60 hertz) and can be plugged into any standard electrical socket. New modern pool system controller have auxiliary plugs/ports that can be programmed to the ionizer turn on and off. Copper ions remain active for a long period of time and you should not have to run the system continuously. These control units may also be plugged into a timer (available at hardware stores) for maintaining a copper residual. The use of an extension cord will not affect this system.

If the unit will be connected to an automated controller, please refer to the instruction manual of that unit and these can be connected to an auxiliary port. Many of the modern control panels will even allow for remote access and ability to manipulate run-time programs.

The electronic controllers must be mounted upright on a wall and preferably at a location underneath the eave of the roof. At no time, should the controller be left laying on a surface facing upwards. By doing so, the controller could be inundated with water and void warranties.

CA10 and CV50

Item #	Description
1	Power Indicator Light. It will remain a solid red color when power is running to the unit.
2	Polarity Light – Cycles on and off every 10 minutes, indicating a reversal of polarity and cleaning cycle.
3	Potentiometer Switch – Rotate clockwise to increase copper output and counter clockwise to decrease copper output.
4	Power Switch – Will allow the user to turn off the system when it is not in use.
5	Electrode Leads – Attaches to the copper electrode (not shown in picture)

--

CV60

Item #	Description
1	LED Display
2	Power ON Switch
3	Power OFF Switch
4	Control Status Indicators
5	Alert Indicator – Alarm codes change depending on application (listed below)
6	Polarity Light – Cycles on and off every 10 minutes, indicating a reversal of polarity and cleaning cycle.
7	Attaches to the copper electrode (not shown in picture)

Controller Description

Functionality

1. The CA10 and CV60 is rated for 2.0 amps. The CV50 is rated at 1.0 amp.
2. The CA10 is rated at 12 VDC. The CV50 and CV60 is rated at 24 VDC.
3. The allowable TDS (salinity) level may be different depending on the internal heating at full load and feedback wave shape.
4. The output current may be reduced depending on the sensed internal enclosure heating.

Operator interface

Display

The CV60D has a two digit seven-segment LED display. The segments are driven direct so a limited set of alpha characters can be displayed in addition to numbers. The LEDs are .56” character height high-efficiency. The CA10 and CV50 does not have an LED display.

The following is a list of displayed variables on the CV60:

1. Setpoint Amps – 00 to 20
2. Cell Amps – 0.0 to 2.0 (accuracy of +/- 0.1 amps)
3. Cell Volts – 1 to 24 (calculated)
4. Control Status & Alerts
 - a. A0 – Normal operation
 - b. E1 – Flow switch open
 - c. E2 – Cell connection problem (cell powered with no feedback)
 - d. E3 – Output reduced because of internal heating
5. Power-up Mode
 - a. P1 – Powers up off (default as shipped)
 - b. P2 – Powers up on

The displayed operating variables will be determined using a SEL panel pushbutton and indicated by discrete **SETPPOINT**, CURRENT, VOLTAGE and STATUS LEDs. *The Power-up Mode will be displayed when the **DATA DOWN ARROW** panel pushbutton is pressed and held down when AC power is being applied.*

Setpoint Select

The setpoint on the CV60 will be adjusted using scroll up and scroll down panel pushbuttons rather than a potentiometer found on the CV50. The DSP will maintain the setpoint value during power down.

Power On & Off

Power on and off on the CV60 shall be selected via ON and OFF panel pushbuttons rather than a power toggle switch found on the CV50. The control can automatically power up on if the P2 option is selected through the Power-up Mode procedure described earlier.

Alert LED

The ALERT LED shall illuminate if any of the E1 to E3 conditions described earlier are present.

Polarity LED

This LED has the same functionality on the CV50 and CV60 product. The polarity changes after 10 minutes or when AC power is applied, but not via the ON and OFF buttons. This is a self-cleaning cycle to keep the cathode and anode clean and reduce the potential of mineral plating.

SECTION 3.0 START-UP PROCEDURES FOR POOL AND IONIZATION UNITS

3.1 Start-up of Pool

This order of instructions should be followed precisely to properly ionize your pool!

1. Clean out all debris and clean out skimmers (Please see Section 9.0 if applicable)
2. Adjust pH between 7.0 – 7.4
3. Run the Ionizer continuously until the copper level reaches 0.5 ppm. **REMEMBER:** Your pool pump must be running and water must be flowing over the copper bars when the Ionizer is on.
4. Treat water clarity
Treat Calcium Hardness

3.2 Initial Start-up for the CV40 (discontinued)

Turn your power switch on and run your system for 24 hours a day until you achieve a 0.5 ppm of copper. The conductivity of your water will dictate the copper output of your electronics system. Conductivity is created by TDS (Total Dissolved Solids) which are mostly comprised of sodium, potassium, and chlorides. If your pool water is too low in these minerals, you may have to run your system over a longer period of time in order to get your copper level up in your pool. If your water has a high level of TDS, then your circuit breaker fuse located underneath the unit may trip. **NOTE: If installed outside, it is best to find a location that would avoid long-term exposure to the elements such as under an awning.**

If your CV40 power and/or polarity light flashes / blinks rapidly, this may be a sign of conductive water. The unit will automatically shut itself off and then try to come back on after the unit cools down. If this continues, please turn the unit off and call Intec at 800-896-1759 and they will provide you a resistor at no charge.

Resistor

Detach any one single line that is attached to the electrode male spade (Figure 3). *It does not matter which line is detached.* Attach the resistor (Shown to the left) to the male spade of the electrode. You will notice that the resistor has two different types of plugs. Only one wire from the Resistor will attach to the electrode. Attach the other wire of the Resistor to the wire you previously detached from the electrode that runs to the electronics unit.

After you have achieved a copper level of 0.5 ppm, you may simply unplug your unit or turn your control unit off. You only need to run the system again when your copper level falls below 0.4 ppm.

3.3 Initial Start-up for the CA10 or CV50

Similar to the above. However, these unit are equipped with a potentiometer to control the copper output. Turn the dial counter-clockwise to the lowest setting, and turn the unit on with water flowing through the copper electrode chamber. As the water is flowing through, turn the dial clockwise until it is on full power. **If the power light flashes/blinks sporadically, turn the knob again counter-clockwise until the power light is solid and not flashing.** This is the maximum output for your pool water conductivity.

3.4 Initial Start-up for the CV60

Similar to the above. However, this unit is equipped with a push buttons to control the copper output. Turn the unit on with water flowing through the copper electrode chamber. As the water is flowing through, pay attention to the LED lights to the right of the display. **If the any light flashes/blinks sporadically, push the down arrow one click at a time until the power light is solid and not flashing.** This is the maximum output for your pool water conductivity.

SECTION 4.0 POOL MAINTENANCE

Copper ions do not evaporate or dissipate. If you keep your pool, skimmers, filter, and the weir basket in the front of the pump clean, the copper ions will remain in the pool. It is the pH level in your pool/spa that is the most IMPORTANT.

If you will keep your pH, alkalinity, copper, and calcium hardness in the recommended ranges, plus the regular use of your filtration aid, your pool water will always be beautiful, clear, light blue, and healthy. That's all there is to it. Now, isn't that simple?

SECTION 5.0 TESTING YOUR POOL'S WATER

Your system contains two test kits, the comprehensive test kit (in the hard blue container) and the copper test kit (in the clear container). The instructions for each test are in

each test kit. Read these instructions carefully. Then do the test. Below are the only tests that you will need to maintain your pool.

- pH
 - Alkalinity
 - Acid Demand
- Calcium Hardness
 - Copper

**NOTES –*

- A. *These Test Kits are made exclusively for Intec. Other tests are shown on the chart but those tests are not necessary to maintain an ionized pool.*
- B. *Anytime you draw a water sample from the pool for testing, make sure you get that sample 12 inches below the pool surface.*
- C. *If ever you have a problem, you may call Intec at 800-896-1759 for assistance. Please test your pool water for the aforementioned parameters before calling Intec. These tests results are needed to diagnose and help you solve your problem. Without them, we will not be able to accurately assist you.*

pH Concentrations Scale

Concentrations of Hydrogen (H ⁺) compared to distilled water		pH	Solutions that typically have this pH
Acidic pH	10,000,000	pH = 0	battery acid
	1,000,000	pH = 1	stomach acid
	100,000	pH = 2	lemon juice, vinegar
	10,000	pH = 3	grapefruit, orange juice, soda
	1,000	pH = 4	tomato juice, acid rain
	100	pH = 5	black coffee, rain water
Neutral pH	10	pH = 6	urine, saliva
	1	pH = 7	"pure" water
Basic/Alkaline pH	1/10	pH = 8	sea water
	1/100	pH = 9	baking soda
	1/1,000	pH = 10	milk of magnesia
	1/10,000	pH = 11	Ammonia
	1/100,000	pH = 12	soapy water, bleach
	1/1,000,000	pH = 13	oven cleaner
	1/10,000,000	pH = 14	liquid drain cleaner

5.1 Test the pH of your pool water first.

If it needs treatment, then treat it before proceeding to the other tests.

If you leave your pH higher than 7.4 for an extended period of time, then dissolved minerals and organics inside of the water molecules (which were previously invisible) can precipitate from solution and become suspended (free floating). This may discolor your water and scale your pool. If the pH is allowed to go below 7 for an extended period of time, the impurities inside the water molecule will discolor or stain your pool. This happens because of the acidic conditions of your water. *Most pool owners will call every discoloration a stain.*

pH is treated with **muriatic acid** to bring it lower and **baking soda** to bring it higher. The muriatic acid will burn up some of the alkaline material, thus reducing your pH. The baking soda will neutralize the acidity, increase the alkalinity, and thus increase your pH. Both chemicals are self-sacrificing and will reach a point of equilibrium, neutralize themselves, and then no longer exist in your pool water in its original form. Therefore, it can be said that you have a chemical-free pool. Muriatic acid is available in one-gallon bottles at Lowes, The Home Depot, and most local hardware stores. Baking soda is available at Wal-Mart, Target, Dollar General, and your local grocery store.

5.1.2 Recommended Testing and pH Range

The ideal for pH is 7.2 (7.0 to 7.4 is OK). At first, test on Monday, Wednesday, and Friday. At some point in time, you may find you never have to treat the pH on Wednesday for example. If this is the case, then you can just test on Monday and Friday.

You have an **acid demand test** in the Comprehensive Test Kit (blue box) that will determine for you the exact amount of muriatic acid needed to bring the pH down from when it is too high. Please see the “Acid Demand Chart” (Table 1) in Chapter 10. You will need to know your pool size in gallons first (See “Table 3” for calculations).

NOTE: It is important to get your pool's pH in its proper range BEFORE starting to test for copper.

5.2 Total Alkalinity (TA) and Treatment

If pH, as stated earlier, is the most important aspect of pool water care, then alkalinity is even more important because it controls the pH. The Total Alkalinity Test is your “crystal

ball” relating to the future rise in your pool water’s pH. The higher the alkalinity, the faster your pH will rise. Example: if your pH is 7.0 and your alkalinity is over 140ppm, then your pH will rise twice as fast as it would if the TA were 70ppm.

5.2.1 The ideal for TA is 50 to 80 ppm (parts per million)

Test as needed - You will learn how long to wait between treatments by testing and finding the TA is still in the proper range. These numbers can vary in some regions.

If your TA gets below 50ppm, then your pH will bounce. This means that you do not have enough alkalinity in your pool to maintain a constant pH. The pH may test differently in different parts of the pool

When your TA reduces to 50ppm add one pound of baking soda for each 5,000 gallons in your pool. Baking soda is available at Wal-Mart in all sizes.

5.3 Copper Ions and Treatment

The ideal level for copper ions is 0.5ppm. Levels in the range of 0.4 to 0.6 are acceptable. Once the copper has reached the desired level of 0.5ppm, you only have to run the electronic unit about one time a week during the day. Test as needed.

NOTE: When you test your pool’s water for copper ions, you look down through the top of the test tube as you hold it ½ inch above the white area of the color comparator.

The first time you test, wait for three (3) minutes before you compare the test tube to the color chart provided with the kit. Then wait for seven (7) additional minutes and compare to the color chart once again. If you get a higher reading, then use a waiting time of ten (10) minutes for future pool water tests.

NOTE: *Make sure your pH is in the 7.0 – 7.4 range. If your pH is higher, your copper ion test will not be accurate. It will not show all the copper ions you have in your water.*

5.4 Calcium Hardness(CH) and Treatment

The purer the water molecule is, the more aggressively it tries to contaminate itself. Calcium chloride reduces the aggressiveness of the water molecule, which in turn, will make the water easier to treat and helping prevent damage to the pool’s surface. One could consider

this being an insurance policy against owner negligence. For example, the damaging effects of low pH water would slightly be negated with calcium being present in the water.

Calcium Hardness (CH) is treated with calcium chloride. This is available at most stores that carry pool supplies. Please see Table 2 for treatment instructions.

NOTE: *The ideal calcium hardness in a vinyl liner, fiberglass, or painted pool is 150 to 200ppm minimum. For a plaster pool the ideal level is 300ppm. Always follow the manufactures' guidelines for your pools surface. Test and treat in the Spring and Fall.*

5.5 Getting The Best Test Results

All treatments for pH, TA or CH should be made with water taken from the pool in a large plastic bucket (5-gallon container for example). ***Please Use Caution.*** The treatment (muriatic acid, baking soda, or calcium chloride) should be totally dissolved and then gently poured into an inlet stream of water. **Do not combine any of these chemicals together.** They must be added separately; i.e., one at a time!

6.0 CLARITY OF POOL WATER

Your pool water clarity is the responsibility of your filter and pump. The pump is responsible for impelling the pool water from the pool and propelling it through the filter. The filter is responsible for clearing the pool water. But, all filters are a trade off of filtration capacity (the size of material the filter can remove) and flow rates (the volume of water that can be processed over a given period of time).

NO FILTER WILL KEEP YOUR POOL PERFECTLY CLEAR. Microscopic particles (suspended solids, hair, suntan oil, body oil, dead skin cells) too small for your filter to catch will accumulate and form a cloud. You will need to use **a *filtration aid*** to keep your pool water clear. Below are the options that you can use to keep it clear:

1. Sequestering Agents
- or
2. Oxidizing Agents

6.1 Sequestering Agents

They are called water polishers, clarifiers, coagulants, light flocks, or sequestering agents. They all do pretty much the same thing. These products will pull together those small particles until they are large enough for the filter to catch. Intec recommends a product called *Super Blue* that is manufactured by Robarb™. It is a corn starch durative. Follow the instructions on the label for the amount to add to you pool. This should be added once a week or as needed. If you see another cloud form during the middle of the week; i.e., after a storm or a heavy bathing load, you may reapply.

6.2 Oxidizing Agents

These products will physically burn up the microscopic particles in your pool. These products are more commonly utilized because of their ease of use and they are a more economical option. The two most common agents are:

- 1. Hydrogen Peroxide
or
- 2. Household Bleach (Sodium Hypochlorite)

To keep these instructions simplified, one can substitute hydrogen peroxide in the place of bleach. Hydrogen peroxide can be substituted for those choosing to live a totally chlorine-free lifestyle. (Hydrogen peroxide is available at Whole-Foods in the laundry section as a bleach alternative). However, please do not be concerned about using bleach. Remember, we are not using a stabilizer such as cyanuric acid which is necessary to keep chlorine in the water molecule. Bleach does not remain in the pool as a weak form of chlorine. Just like the muriatic acid, it is self-sacrificing, and does not remain in your pool after it finishes doing its job of oxidizing.

Once a week, add one quart of bleach or hydrogen peroxide for each 8,000 gallons of water in your pool (even if the pool water is perfectly clear). This treatment will prevent a cloud from forming. Look at the clarity of your pool water often. Any time the water is not clear, add one quart of bleach for each 8,000 gallons of water.

Testing Schedule

Monday	Wednesday	Friday
--------	-----------	--------

Test for pH. Treat if necessary. Takes less than 10 minutes	Same as Monday. Takes less than 10 minutes	Test pH and treat if necessary. Test alkalinity. Will need to treat every five or six weeks. Test copper and treat as needed. Treat pool for clarity. Less than 20 minutes combined.
---	---	---

Total time is less than forty minutes a week. Water is always clear, blue, and very healthy.

NOTE: Wait for a minimum of 30 minutes after treating pool before allowing anyone to swim. When treating your pool, make sure that you are running the pump and recirculating the water.

6.3 Pool Filters

6.3.1 Diatomaceous Earth (DE) Filter – This system will filter suspended solids from your water down to 10 microns. This is very good; however, the DE filter will cause the TDS (total dissolved solids) to increase. This increase will cause your treatments to work less effectively and those treatments will take a little longer to take effect.

6.3.2 Zeolite Filter - (also known as Zeosand or Zeobrite) will filter your pool water down to 5 microns, which is even better.

The above two filters have one major problem. They both use a lot of pool water for backwashing. The backwashing takes the water that you have been testing and treating out of the pool. This requires you to refill the pool with untreated water thus changing your water test parameters. Now you have to do your testing and treatment all over again to attain the previous levels achieved before the filter was backwashed.

6.3.3 Cartridge Filter - This will filter the pool water to 20 microns and it requires no backwashing. You simply take the cartridge out and clean it with a sweeper nozzle. The nozzle is available at any hardware store. You have not changed one gallon of the pool water chemistry and you do not have to retest and retreat the water.

Intec is not recommending that you change your filter, but that you learn to work with the one you have. If ever you have problems with your present filter, then you might consider changing to the cartridge filter.

SECTION 7.0 TIPS TO PERFECTION

- A. Always err on the side of under treating your pool water rather than over treating your pool water.
- B. On a new pool or one under construction, be sure to tell the pool builder *not to put any chemicals in the water*. Tell him you will start taking care of it from the very beginning. Sometimes they will put a Metal-Out product in the water. This product will take the copper ions out of the water as fast as the electronic unit can put them in until all of the Metal-Out is out.
- C. When you are using the ionization unit, ***the pool pump must always be running*** so the copper ions can be flushed from the electrode into the pool.
- D. Test accurately and often. Make small treatments when necessary. Insufficient testing and treatment will ultimately take more time and more money. Your water will always be perfect with consistent testing and treatment.
- E. Keep on hand all the supplies you might need for two months.

- F. Operate the pump during the day which is when your water is under the most stress. Recommended hours to run pool pump:

Daily High Temp	Hours
90-95	12
85-90	10
80-85	8
75-80	6
70-75	4

- G. Do not use any algaecides because copper ions are the single best algaestat on planet earth. Many algaecides are copper based. Adding algaecides will cause you to get a high false reading on the copper test.

- H. When you notice your pool water is discolored (*before you do anything else*), check and treat your pH if high. Then wait until the next day because your water may clear. This is caused by the lower pH reabsorbing whatever caused the discoloration.
- I. Get the water from the pool for testing about 12 inches below the surface.
- J. Algae should never be allowed to infest the pool. This may happen when you go on vacation and the pool water has not been properly tested and treated. Once the pool water is properly tested and treated, the copper will kill the algae but will not make it disappear. Start an oxidation program (See Section 6.2) of one quart of Bleach or Hydrogen Peroxide for every 8,000 gallons a day until the algae is no longer visible. Even though the algae are dead, they may still retain their color and stickiness for several days.

SECTION 8.0 STAINS AND SCALE

This was discussed earlier in Section 5.1 (under pH). In pools, stains and scale are either caused by low pH or high pH.

First test and treat your pH, and then wait one day. If the stain or scale still exists then use a product called *Stain Tamer* to remove the stain or scale. Be careful not to use a product called Metal Out. Metal Out, and others like it, can bind up the copper ions in your swimming pool/spa, making them ineffective.

If a stain appears on the steps or swimout, you may use the muriatic acid (the same as you use to lower the pH) to remove it.

SECTION 9.0 TRASHED POOL TREATMENT

- A. Remove all trash from pool. Do not leave a single leaf!
- B. Clean skimmer baskets, and pump weir basket.
- C. Put filter on re-circulate and add proper amount of Drop-Out or Heavy Flock. (Follow Drop-Out instructions especially regarding the pH) With filter on re-circulate, run pump for 2 hours then cut pump off.
- D. 24 hours later, hand vacuum slowly to remove waste. Wait one more day as pool water may drop out additional waste during this time.
- E. You may have to add water to your pool when water goes below the skimmer. If this happens, then you MUST:

1. Readjust your pH,
 2. Test and adjust copper,
 3. Test total alkalinity, and
 4. Test calcium hardness
- F. Add Stain Tamer if needed. Please note - Use only products called Drop-Out and Stain-Tamer. Do not substitute. Results will vary according to the pool condition.

SECTION 10.0 CHARTS

Table 1

To Decrease pH Using Muriatic Acid with Acid Demand Procedure

Drops of Acid Demand Reagent	500 Gallons	1,000 Gallons	5,000 Gallons	10,000 Gallons	20,000 Gallons	50,000 Gallons
1 Drop	0.9 oz.	1.8 oz.	9.1 oz.	1.1 pts.	2.3 pts.	5.7 pts.
2 Drops	1.8 oz.	3.6 oz.	1.1 pts.	2.3 pts.	4.6 pts.	11.4 pts.
3 Drops	2.7 oz.	5.5 oz.	1.7 pts.	3.4 pts.	6.8 pts.	17.1 pts.
4 Drops	3.6 oz.	7.3 oz.	2.3 pts.	4.6 pts.	9.1 pts.	22.8 pts.
5 Drops	4.6 oz.	9.1 oz.	2.8 pts.	5.7 pts.	11.4 pts.	28.5 pts.
6 Drops	5.5 oz.	10.9 oz.	3.4 pts.	6.8 pts.	13.7 pts.	34.2 pts.

25' x 50'	32,800	37,500	42,200	46,900	51,600
30' x 50'	39,375	45,000	50,525	56,250	61,875

SECTION 11.0 WARRANTY AGREEMENT

The Intec Warranty Agreement applies to the following current models: CV50 and the CV60. It also applies to the following discontinued models (Water Doctor I, Water Doctor II, Genesis Expanse, Water Magic II, Water Magic III, CV10, CV40). Intec America Corporation offers a 10-year “Pro-Rated Warranty” on its copper ionization systems. Intec warrants that all equipment is free from defect and will replace purchased equipment according to the prorated schedule below. You will need: 1.) A copy of the purchase receipt, 2.) Copy return of original registration, and 3.) Return of the faulty merchandise (excluding test kits and electrode). The customer must call in advance to receive a return authorization number (RAN) from Intec. (Please see note below). Acts of God and negligence are not considered to be manufacturing defects and will not be covered under this warranty.

1st Year - 100%	6th Year - 40%
2nd Year - 65%	7th Year - 30%
3rd Year - 60%	8th Year - 20%
4th Year - 55%	9th Year - 10%
5th Year - 50%	10th Year - 5%

For example, replacement cost during year 3 is 60% off the currently advertised price. If the current retail price is \$1,000, then your replacement cost is \$400.00 [\$1000 – \$600]. The client always has the option to have the unit repaired. Repair costs can vary and may often be a more cost-effective alternative. The option for repair will continue for the life of the system.

NOTE:

If you ever need to send a unit back for a warranty return/repair, please call first so we can issue a Return Authorization Number (RA#). This number must appear on the outside packaging. If the RA# is not present, the routing may be delayed or the package could be refused.

NOTES
